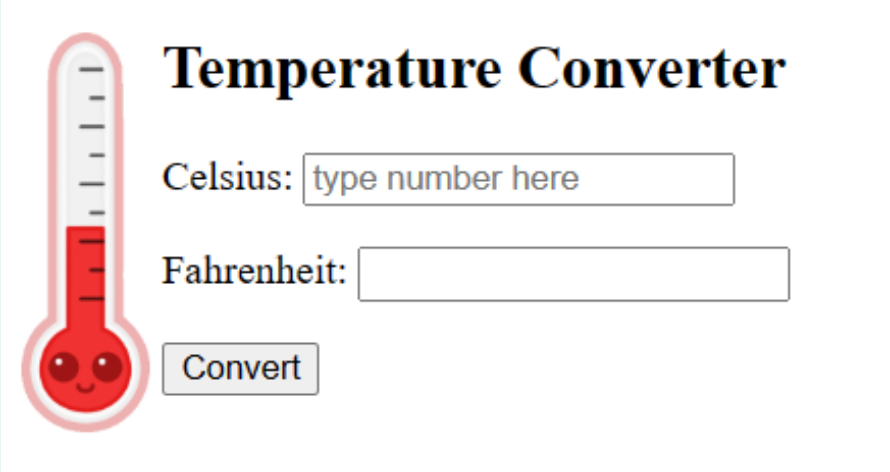
INTRODUCTION

For this assignment, I designed a temperature converter that goes from Celsius to Fahrenheit. When the convert button is pressed, the temperature is converted. It only goes one direction, and cannot process anything that isn't a number or E.



ELEMENTS USED

This project was more complex than before, as I had to use three programming languages to create my temperature converter.

1

HTML

TML is the backbone of this whole project, as it's what sets up the site for usage and enables me to add CSS and Javascript coding. It was the second easiest part for me.

2

CSS

I found CSS to be the simplest part of the coding process. All I really had to do was type in what I wanted for each DIV, and then insert them into the proper places.

3

Javascript

I had a lot of trouble with coding JavaScript, since I was still inexperienced with it. It took some time to force the site not to convert the code automatically, as it kept doing.

TROUBLE

While I worked through the project, I encountered several issues. Most of these were fixed easily, but I still think it's a good idea to note what went wrong for next time.

Problem	Solution	Final Outcome
The converter wasn't converting properly	I wasn't using the right equation for celsius -> fahrenheit	It converted properly
The Fahrenheit box wasn't going below -17.2 or so	I moved the <script> box elsewhere, specifically under the html tag	The box now showed the correct values below -17.2
The CSS file was not showing the effects on the webpage	I made a mistake on the file name, so I changed it	I just changed the name. I hope this doesn't happen again

NEXT STEPS

What should I do next... I definitely still need to study javascript, and also I need to figure out how to delay the script in order for it to work properly.

1

JavaScript coding

My first next step is definitely to go deeper into JavaScript, especially for the final project.

2

Organization

My problems were in part due to me not tagging code properly and just placing it everywhere. Next time, I'll make sure to tag everything properly to prevent this.

3

More styling

I don't really style my text much, preferring functionality over appearances. I think my sites could benefit from a bit more styling.

CONCLUSION

This assignment did help me learn JavaScript. It was difficult but fun. Maybe doing this more could help.

Conversion

- Conversion was the most interesting part for me. Since I didn't know the formula for either, I had to get it from the w3schools site.

Thermometer

- The thermometer is cute.

BIBLIOGRAPHY

I used two sites for the assignment, and also the lectures posted on brightspace.

"How To Create a Temperature Converter With HTML and Javascript." w3schools, Refsnet Data, https://www.w3schools.com/howto/howto_js_temperature_converter.asp.
